○ Problem statement : A Personal Budget Tracker: It is an app/website that helps users to keep track of their expenses and income.

WEBSITE NAME : BUDGET TRACKER

- How do websites operate?

  1. Firstly, user can login with the username and password.

  2. Then, user is directed to dashboard.

  3. Dashboard shows an overall of budget, today's budget entries, today's budget expenses.

  4. The overall budget average for any specific time period that the user had set in the settings is included in the

overall budget.

5. It displays the budget expenses and entries for today.

6. There is also a budget category where all expenses are divided into different budget types, such as those for food, clothing, household items, etc.

7. Along with budget management, we have. Every detail, including the date, category, and amount, is displayed in budget management.

8. Along with budget management, we have. Every detail, including the date, category, and amount, is displayed in budget management.

9. Here, we also have budget report.it will shows report of budget in a proper way.

10. B+udget report shows budget's starting date , budget's ending date and also shows one table in which we can see entry of date-time,category,amount and remark.

11. We have expense report also. It will shows report of expense in a proper way.

12. Expense report shows expense's starting date , expense's ending date and also gives us one table form in which we can see entry of date-time,category,amount and remark.

13. In the budget tracker we have category list in which there are some different types of catagories like main budget , water , electricity , maintenance etc..

14. In the catagory list we can see date of creation , category, description.

15. We also have settings in which we can see system information.

16. Settings shows us to system name, system short name and system logo.

Note : Xampp is compulsory download.
